LITHUANIAN INTEGRATED LIBRARY INFORMATION SYSTEM (LIBIS)

SOLUTION DESCRIPTION

The purpose of LIBIS system is to automate main library processes: from acquisition and cataloguing to circulation (library customer services), including internet based services from user registration to receiving a document/e-service. LIBIS system is integrated with a RFID (Radio-frequency identification) self-service equipment, so users can lend and return documents themselves and return them outside the library's working hours dropping them into special drop-boxes. A specialized software is developed for reading electronic books on e-book readers.

BENEFITS

- Saving time of librarians and readers, accessibility for people with disabilities.
- Servicing users independently from the library's working hours.
- All libraries in a single library network.
- Universal: comprises all library services including a Union catalogue and other general databases.
- Multilingual and multiscript: library documents can be described in source language using different language symbols in each record (e.g., Hebrew, Arabic).
- No data duplication: single entry and reusability of data across the library system or even within the network of libraries.
- Various search possibilities: single-field and advanced search in all national public libraries, thesaurus.
- Connection to various external databases: Authority Records, UDC, MeSH, Eurovoc, etc.

ABOUT COMPANY

Asseco Lietuva, UAB (Asseco Lithuania) is a Lithuanian software development and system integration company, belonging to Asseco Group, that is the largest IT group in Central and Eastern Europe.
